

## BASS CONTROL

The active module BASS CONTROL of WLM will enable you regulate the joint operation of main speakers and subwoofer.

Its main purpose is the perfect integration of the subwoofer in the overall sound reproduction.

A low bass chassis or a subwoofer that is not in perfect tune with the main speakers will jeopardize the reproduction of music.

To achieve the objective of perfect integration of the two speaker systems, the active BASS CONTROL module lets you adjust volume and cut-off frequency levels separately.

An additional, very useful feature of BASS CONTROL is the regulation ("Equalize") of the bass contour to the prevailing room acoustics. With this adjustment you are able to tune e.g. the DUO Subwoofer of WLM within your system. You may choose and set the preferred characteristics of your bass reproduction: you may prefer a slim, dry, fast bass or do you want to support you main speakers by fuller, warmer and more emotional low frequencies? BASS CONTROL gives you the flexibility of an individual adjustment.
